AI-BASED APPROACH FOR EARLY DIAGNOSIS...
Serge Lionel Nikiema, December, 2022

Abstract
A hemorrhagic stroke is a life-threatening medical condition that happens when a blood vessel in your brain ruptures and bleeds.It constitutes a burden on health services and the victim's family. The current definitive diagnosis of stroke is based on brain scanning...

Fakipedia: Building and exploiting an AI model for detecting online fake news in Burkina Faso
Angelique Sidbewendin Yameogo,
Misinformation poses a significant challenge, especially in developing countries with low literacy rates. The rapid spread on social media, coupled with their lack of robust verification mechanisms, makes distinguishing between credible and false information increasingly difficult. This document outlines our efforts to address this challenge in Burkina Faso using the pre-trained linguistic model CAMEMBERT. Our preliminary results show high performance (up to a 99.34% F1 score) on Fakipedia, suggesting that certain blatant instances of false information can be effectively identified and stopped by automated tools...

AI-driven Generation of News Summaries Leveraging GPT and Pegasus Summarizer for Efficient Information
Issiaka Faissal Compaore,
The surge of online information makes it challenging to access relevant news quickly. This necessitates automated methods to effectively extract and summarize information. Our research focuses on designing an online press synthesis tool using advanced AI models. We investigate the feasibility of employing two pre-trained models, GPT-3.5 Turbo 16k and Pegasus Summarizer, to generate high-quality summaries from scraped articles. Our methodology encompasses robust web scraping, model integration, and metric evaluation. Experimental results demonstrate that GPT-3.5 Turbo 16k outperforms in...

Text-to-OWL: Automated Ontology Construction for Tuberculosis Treatment Recommendation using Generative AI
Zonabo Ouédraogo,
This paper presents an automated approach for building ontologies to improve treatment recommendations for tuberculosis (TB), in particular multidrug-resistant tuberculosis (MDRTB) cases in Burkina Faso, using generative language models such as GPT-3. The aim is to facilitate the personalization of treatments according to the patient profile and drug resistance. Two approaches were explored: a automated approach based on the DaVinci GPT-3 model to generate OWL axioms from natural language sentences and a semi-automated approach using text extraction and natural language processing (NLP)...
